                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein search, using

                                                                      Treating retroviral associated neurological disease - by admin. of by-stander antigen, causing release of transforming growth factor beta from suppressor Tcells
Disclosure; Page 49; 64pp; English.
Myelin basic proteins (sequences R48592-96) and cattle proteolipid protein (R48592) elicit the release of TGF-beta from suppressor Tcells and target the T-cells to neural tissue under cytotoxic attack, thereby reducing neurological disease, e.g. HTLV-1 associated myelopathy, tropical spastic paraparesis and HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide analogues comprising at least seven amino acids from residues 86-99 of human myelin basic protein (MBP), can be used to treat multiple sclerosis by competing for the binding of native MBP peptide to MHC and by not causing proliferation of an MBP reactive cell line. The peptide analogues also inhibit the induction of experimental allergic encephalomyelitis (EAE) by MBP in rodents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proteolipid protein; myelin basic protein; retrovirus; neurological disease; by-stander antigen; TgG-beta; transforming growth factor-beta; T-cell; T-lymphocyte; myelopathy; paraparesis; human immunodeficiency virus type 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hafler DA, Weiner WPI; 94-082786/10.

The native human 21.5 kDa foetal isoform (W00399) of myelin basic protein, MBP+X2Cy881, includes an exon 2-encoded region (X2) that may contain an epitope involved in the pathogenesis of multiple sclerosis (MS); the X2 region is not found in the MBP of healthy adults. Recombinant MBP+X2, or variants modified to improve bacterial expression (see also W66107), can be produced in a large scale in bacterial hosts. They are useful for assaying T-cells for responsiveness to MBP epitopes and can be used as therapeutic agents that act by inducing T-cell responses, including anergy and apoptosis, as a means of treating MS.

A 21.5 kDa foetal isoform (W06107) of myelin basic protein, MBP+X2Cy881/Dact., is the product of a DNA construct (T4.1896) based on the human foetal MBP+X2Cy881 isoform (W00399) but utilising bacterially-preferred codons in place of the native human codons (see also T41889). This increases prodn. of the MBP in E. coli by at least 50%. Recombinant MBP 21.5 polypeptides (see also W00399 and W06108) are useful in the clinical assessment, diagnosis and treatment of MS.

This allows large-scale prodn. and purification of the MBP in bacterial hosts. Recombinant MBP 21.5 polypeptides (see also W00399 and W06107) useful in the clinical assessment, diagnosis and treatment of Marchael and Marchael assessment, diagnosis and treatment of Marchael assessment, diagnosis and treatment of Marchael assessment.

Claim 34; Page 110-112; 156pp; English.
MP4 chimera (W06103) is a fusion protein composed of human myelin
basic protein (MBP) foetal isoform MBP21.5 (see also W00399) and
delta PLP4 (W06101), a proteolipid protein (PLP) mutein that lack;
all 4 hydrophobic domains of native human PLP (W06106) but
all 4 hydrophobic associated with multiple sclerosis (MS). I
                                                                                                                                                                                                                                                                                                  22-APR-1995;

                                                                                                                                                           PM4 chimera (W05104) is a fusion protein composed of delta PLP4 (W05101) and MBP21.5 (W00399). Delta PLP4 is a proteolipid protein (PLP) mutein that lacks all 4 hydrophobic domains of native human PLP (W05106) but includes PLP epitopes associated with multiple sclerosis (WS). MBP21.5 is a foetal isoform of human myelin basic protein (MBP) associated with MS. PM4 is in reverse orientation to MP4 chimera (W05103). It can be expressed in bacterial host cells using a DNA construct (T41894). PLP polypeptides (see also W00400, W05101-03 and W05105) can be used in the clinical assessment, diagnosis and treatment of MS.
                                                                                                                                                                                                                                                                                                                                                                                (ALEX-) ALEXION PHARM INC.

MP3 chimera (M06102) is a fusion protein composed of human myeli
basic protein (MBP) foetal isoform MBP21.5 (see also W00399) and
delta PLP3 (W00400), a proteolipid protein (PLP) mutein that lac
hydrophobic domains 1, 3 and 4 of native human PLP (W06106) but
includes PLP epitopes associated with multiple sclerosis (MS).
can be expressed in E. coli transformate using a DNA construct
(T41892) contg. the MBP21.5-delta PLP3 gene fusion. MP3 chimera
and other novel PLP/MBP21.5 polypeptides (W00399-400, W06101-08)
after useful for the clinical assessment, diagnosis and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MP3 chimera (MBP21.5-delta PLP3 fusion).

MMOGP4 chimera (W06105) is a fusion protein composed of human myelin basic protein (MBP) foetal isoform MBP21.5 (see also W00399), the extracellular domain of human myelin oligodendrocyte glycoprotein (MOG) and delta PLP4 (W06101), a proteolipid protein (PLP) mutein. MBP21.5, PLP and MOG are all recognised by autoreactive T cells from multiple sclerosis (MS) patients. The chimera was produced using a DNA construct (M1895) obtd. by inserting a sequence encoding the MOG moiety into MP4 chimera DNA (see also T41893). MMOGP4 chimera can be expressed in bacterial cell hosts. PLP and MBP polypeptides (see also W00400, W06101-04, W06107-08) are useful in the clinical assessment, diagnosis and treatment of MS.
           immune response such as auto:immunity Claim 30; Page 68 + Fig 7; 93pp; English.

A method is claimed for the prepn. of a pure major MHC-peptide complex. The MHC component is a Class II glycoprotein of the and the peptide comprises amino acids 1-14 of MBP.

                                                                                                                                   Homologous peptide analogues of human basic myelin protein - us for treating multiple sclerosis
Disclosure; Fig 4, 26pp: English.
The sequence is that of human basic myelin protein (BMP). Frag of this sequence are claimed (see features) which are able to neutralise anti-BMP antibodies and are thus useful in treatment multiple sclerosis. The fragments may be prepd. Synthetically avoids the dangers associated with the use of the natural prote e.g. transmission of neuroviruses. Also the peptides are too sequence 170 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R35440;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent claims complexes of formulae (I), (II) and (III) which are as follows: (I) x - MCH - peptide; (II) MHC - peptide - x; (III) MHC - peptide. The peptide - x; (III) MHC - peptide. Where x - toxin or labelling gp; MHC - effective portion of the major histocompatibility glycoprotein; and the peptide includes an epitope associated with one of the major autoimmune diseases, including multiple sclerosis (MS). MBP is the principle autoantigen in MS and is a candidate peptide for insertion in the complexes which can be used to treat and monitor MS. Pertinent sections of MBP are determined empirically, using a strain of mice which develops experimental allergic encephalities when immunised with bovine MBP. The sequence given in p94717 is with the substitution of the residues above the sequence in Fig 7. The sequence without substitutions is given in p92226.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      28-DEC-1989.

The present sequence represents a myelin basic protein (MBP) protein fragment used to produce MBP peptides. MBP peptides are capable of neutralising or modulating the production of anti-myelin basic protein. The present invention also describes a method for treating multiple sclerosis (MS). The method comprises administering to the patient an MBP peptide of the formula: R1-Val-His-Phe-Phe-Lys-Asn-Ile-R2 where R1, R2 = H, OH, or an amino acid residue and a polypeptide residue, provided that R1 and R2 are not both H or OH at the same time.

By and yas eight myelin basic proteins can be encoded by the same gene by alternative splicing. The sequence below is missing exons 2 and 5 of the gene and encodes a 17.22 kba myelin basic protein. The variations in the 3' untranslated regions between the two clones may be reverse transcriptase errors [1].

Location/Qualifiers
Identification of a cDNA coding for a fifth form of myelin basic
                  protein in mouse

Disclosure; Figure 1: 61pp; English.
Disclosure; Figure 1: 61pp; English.
Peptide analogues comprising at least seven amino acids from residues 86-99 of human myelin basic protein (MBP), can be used to treat multiple sclerosis by competing for the binding of native MBP peptide to MHC and by not causing proliferation of an MBP reactive Tecal line. The peptide analogues also inhibit the induction of experimental allergic encephalomyelitis (EAE) by MBP in rodents.
The peptide analogues have a reduced susceptibility to proteolysis

A cDMA sequence (T41899) codes for the native human 21.5 kDa foetal asoform (W00399) of myelin basic protein, WBP+X2Cy881/hum. This isoform (W00399) of myelin basic protein, WBP+X2Cy881/hum. This isoform includes an exon 2-encoded region (X2) that may contain an epitope involved in the pathogenesis of multiple sclerosis (KS); the X2 region is not found in the MBP of healthy adults. The CDNA can be obd. by PCR amplification (see also T42785-90) and used to produce recombinant MBP 21.5 in host, pref. bacterial, cells (see also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human myelin basic protein and proteolipid protein variant(s) used in the assessment, diagnosis and treatment of multiple

A DNA sequence (T41896) codes for the human 21.5 kDa foetal isoform (W06107) of myelin basic protein, MBPA-X2CygSAI/bact., and utilises bacterially-preferred codons in place of the native human codons (see also T41889). This increases prodn. of the MBP in E. coli by at least 5%. Recombinant MBP 21.5 polypeptides (see also W00399 and W06108) are useful in the clinical assessment, diagnosis and treatment of MS.

Claim 46; Page 110-112; 156pp; English.

Calm 67; See also W0039) and delta PLP4 (W06101), a proteollipid protein (PLP) mutein that lacks all 4 hydrophobic domains of protein (PLP) mutein that lacks all 4 hydrophobic domains of protein (PLP) mutein that lacks all 4 hydrophobic domains of mative human PLP (W06106) but includes PLP epitoppes associated with cultiple sclerosis (MS). It was constructed from DNA sequences condity MBP21.5 (T41889) and delta PLP4 (T41891). The gene fusion control pET22b was used to express MP4 in E. coli Wallo (DE3).

Calm vector pET22b was used to express MP4 in E. coli Wallo (DE3).

Calm vector pET22b was used to express MP4 in E. coli Wallo (DE3).

Calm vector pET22b was used to express MP4 in E. coli Wallo (DE3).

Calm vector pET22b was used to express MP4 in E. coli Wallo (DE3).

Calm vector pET22b was used to express MP4 in E. coli Wallo (DE3).

Calm vector pET22b was used to express MP4 in E. coli Wallo (DE3).

Calm vector pET22b was used to express MP4 (T41891). The gene fusion be used in the clinical assessment, diagnosis and treatment of MS.

A DNA construct (T41882) codes for MP3 chimera (W06102), a fusion protein composed of human myells basic protein (MBP) foetal isoform MBP21.5 (see also W00399) and delta PLP3 (W00400), a proteolipid protein (PLP) mutein that lacks hydrophobic domains 1, 3 and 4 of native human PLP (W06106) but includes PLP epitopes associated with multiple sclerosis (WS). It was constructed from DNA sequences encoding MBP21.5 (T41889) and delta PLP3 (T41890). The gene fusion in vector PET22b was used to express MP3 in E. coli W110 (DB3). PLP polypeptides (see also W00400, W061010 and W06103-05) can be used in the clinical assessment, diagnosis and treatment of MS. Sequence 1155 BP; 239 A; 363 C; 306 G; 247 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 48; Page 115-117; 156pp; English.

C A DNA construct (T41895) codes for MMOGP4 chimera (W06105), a fusion protein composed of human myelin basic protein (MBP) foetal isoform MBP21.5 (see also W00399), the extracellular domain of human myelin protein composed of human myelin takes also w00399), the extracellular domain of human myelin coligodendrocyte glycoprotein (W06) and delta PLP4 (W06101), a proteolipid protein (PLP) mutein that lacks all 4 hydrophobic domains of native human PLP (W06106) but includes PLP epitopes associated with multiple sclerosis (MS). It was constructed by inserting a sequence encoding the MOG molety into MP4 chimera DNA (see also T41893) between the MBP and PLP derived sequences. The recombinant MMOGP4 chimera can be expressed in bacterial cell hosts. PLP polypeptides (see also W00400 W06101-03 and W06105) are useful in the clinical assessment, diagnosis and treatment of MS. Claim 47; Page 113-114; 156pp; English.

DNR construct (141894) codes for PM4 chimera (W06104), a fusion protein composed of delta PLP4 (W060101) and MBP21.5 (W00399).

Delta PLP4 is a proteolipid protein (PLP) mutein that lacks all 4 hydrophobat domains of native human PLP (W06106) but includes PLP epitopes associated with multiple sclerosis (MS). MBP21.5 is a foetal isoform of human myelin basic protein (MBP) associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human myelin basic protein and proteolipid protein variant(s) used in the assessment, diagnosis and treatment of multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MBP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-FEB-1997 (first entry)
PM4 chimera (delta PLP4-MBP21.5 fusion) DNA.
Protecolipid protein; PLP, delta PLP4; myelin basic protein;
